

How to backup and restore a partition table on Linux

in Backup & Recovery, BASH Shell, CentOS, Debian / Ubuntu, Linux, RedHat and Friends, Suse last updated December 30, 2015

Is it possible to just backup my Linux partition table and restore it when required? How do I restore partition table if it get deleted by mistake on Linux operating system? How do I backup and restore a GPT partition table on Linux?

Yes, you need to backup both data and disk's partition table. This is useful for:

- 1. Replicating disk's partition for Linux software RAID in case of disk failure.
- 2. Dealing with corrupted partition table
- 3. Dealing with deleted partition table by mistake as data may still exists on the disk and can be accessed again with a correct partition table.

**WARNING!** These examples may crash your computer if NOT executed with proper care. BE EXTREMELY CAREFUL WITH THE FOLLOWING COMMANDS. ONE TYPING MISTAKE AND ALL YOUR DATA IS LOST.

How to see my current partition table

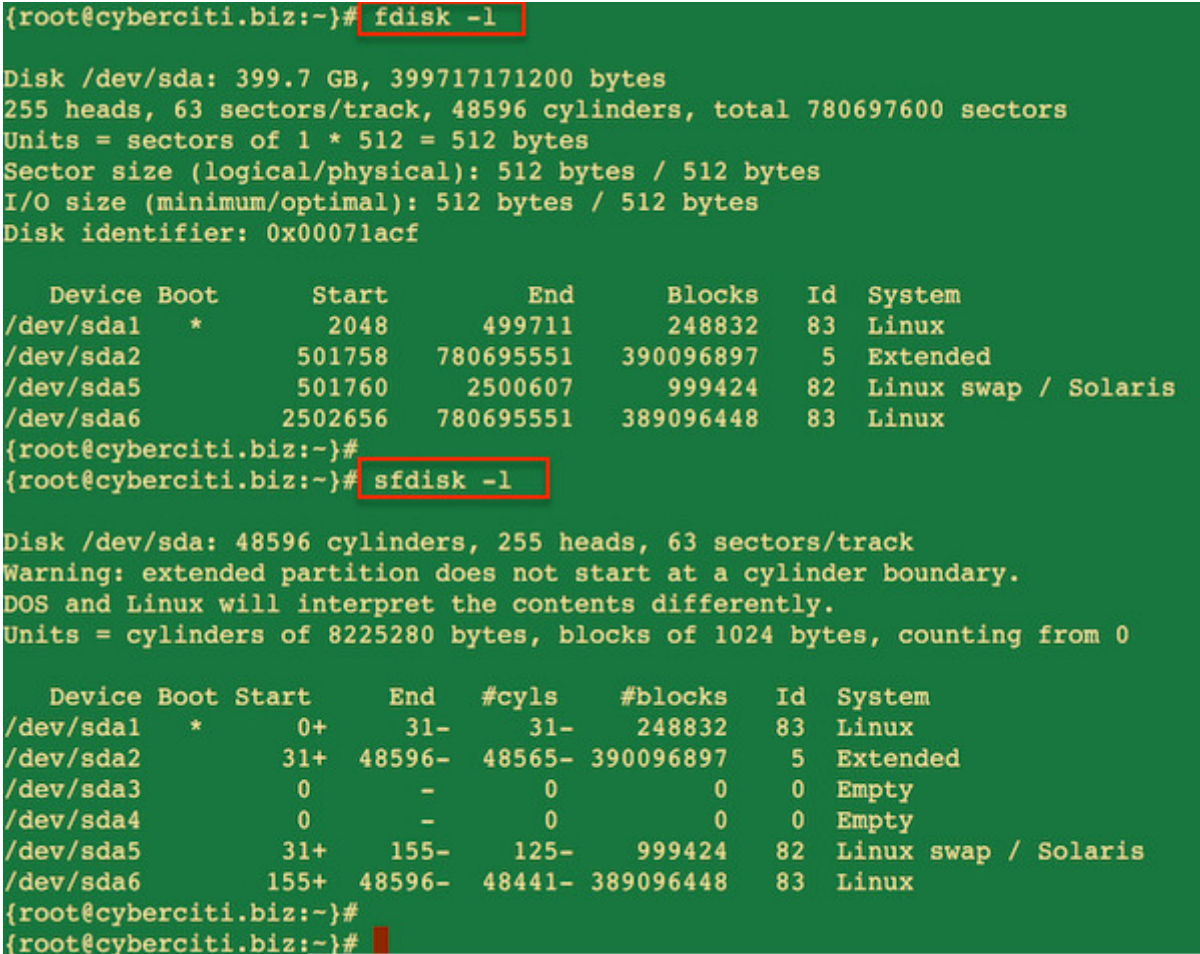

Type the following command to list partitions of each device:

```
# fdisk -l
# fdisk -l /dev/sda
```

OR

```
# sfdisk -l
# sfdisk -l /dev/sda
```

Sample outputs:

```
{root@cyberciti.biz:~}# fdisk -l

Disk /dev/sda: 399.7 GB, 399717171200 bytes
255 heads, 63 sectors/track, 48596 cylinders, total 780697600 sectors
Units = sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00071acf

   Device Boot      Start         End      Blocks    Id  System
/dev/sda1  *        2048       499711       248832    83   Linux
/dev/sda2                501758      780695551      390096897     5   Extended
/dev/sda5                501760       2500607        999424    82   Linux swap / Solaris
/dev/sda6                2502656      780695551      389096448    83   Linux

{root@cyberciti.biz:~}#
{root@cyberciti.biz:~}# sfdisk -l

Disk /dev/sda: 48596 cylinders, 255 heads, 63 sectors/track
Warning: extended partition does not start at a cylinder boundary.
DOS and Linux will interpret the contents differently.
Units = cylinders of 8225280 bytes, blocks of 1024 bytes, counting from 0

   Device Boot  Start      End  #cyls   #blocks    Id  System
/dev/sda1  *         0+        31-     31-     248832    83   Linux
/dev/sda2         31+    48596-   48565-   390096897     5   Extended
/dev/sda3           0         -         0           0     0   Empty
/dev/sda4           0         -         0           0     0   Empty
/dev/sda5         31+     155-     125-     999424    82   Linux swap / Solaris
/dev/sda6        155+   48596-   48441-   389096448    83   Linux

{root@cyberciti.biz:~}#
{root@cyberciti.biz:~}#
```

List the partition tables for the specified device

Fig.01: Linux List Disk Partitions Command

How do I back-up Linux partition with sfdisk command?

To backup /dev/sda partition table, enter:

```
# sfdisk -d /dev/sda > sda.partition.table.12-30-2015.txt
```

Copy sda.partition.table.12-30-2015.txt to NFS mounted share or a USB pen drive.

How do I restore the Linux partition with sfdisk command to the disk?

```
# sfdisk /dev/sda < sda.partition.table.12-30-2015.txt # sfdisk /dev/sda < /path/to/usb/pen/sda.partition.table.12-30-2015.txt
```

OR

```
# sfdisk -f /dev/sda < /media/usb/sda.partition.table.12-30-2015.txt
```

How do I replicate a disk partition table from /dev/sda to /dev/sdd with the same geometry?

This is useful for Linux based software RAID device. Say you replaced /dev/sdd and you want to rebuild the Linux software RAID array. The first step is to replicate a partition table from a disk to another disk:

```
# sfdisk -d /dev/sda | sfdisk -f /dev/sdd
```

Now, run the following to verify that both hard drives have the same partitioning:

```
# fdisk -l /dev/sda
# fdisk -l /dev/sdd
```

Finally, use mdadm to manage and rebuild your RAID device:

```
# mdadm --manage /dev/mdX --add /dev/sdd1
# mdadm --manage /dev/mdX --add /dev/sdd2
....
..
# mdadm --manage /dev/mdX --add /dev/sddN
```

Use the following command to see raid array sync progress:

```
# watch cat /proc/mdstat
```

A note about disks with GPT (GUID Partition Table)

From the man page:

GPT fdisk (aka gdisk) is a text-mode menu-driven program for creation and manipulation of partition tables. It will automatically convert an old-style Master Boot Record (MBR) partition table or BSD disklabel stored without an MBR carrier partition to the newer Globally Unique Identifier (GUID) Partition Table (GPT) format, or will load a GUID partition table. When used with the -l command-line option, the program displays the current partition table and then exits.

Let us install gdisk on a Debian or Ubuntu Linux using [apt-get command](#):

```
$ sudo apt-get install gdisk
```

Sample outputs:

```
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following extra packages will be installed:
  libicu52
The following NEW packages will be installed:
  gdisk libicu52
0 upgraded, 2 newly installed, 0 to remove and 0 not upgraded.
```

```
Need to get 6,937 kB of archives.  
After this operation, 28.7 MB of additional disk space will be used.  
  
Do you want to continue? [Y/n] y  
Get:1 http://archive.ubuntu.com/ubuntu/ trusty-updates/main gdisk amd64 0.8.8-1ubuntu0.1 [185 kB]

Setting up libicu52:amd64 (52.1-3ubuntu0.4) ...  
Setting up gdisk (0.8.8-1ubuntu0.1) ...  
Processing triggers for libc-bin (2.19-0ubuntu6.6) ...
```

RHEL/CentOS user use the [yum command](#) to install the same:

```
# yum install gdisk
```

Fedora Linux user use the dnf command to install the same:

```
$ sudo dnf install gdisk
```

OpenSUSE Linux user use the yast command to install the same:

```
# yast install gdisk
```

Please note that sgdisk command works with both Linux and Unix-like system.

How do I backup /dev/sda GPT partition table to a file?

To save partition data to a backup file called /root/sda_partition_table_12_30_2015, run:

```
# sgdisk --backup={/path/to/file} {/dev/device/here}  
# sgdisk --backup=/root/sda_partition_table_12_30_2015 /dev/sda
```

How do I restore GPT partition table from a file?

To restore the backup use:

```
# sgdisk --load-backup={/path/to/file} {/dev/device/here}  
# sgdisk --load-backup=/media/usb/sda_partition_table_12_30_2015 /dev/sda
```

How do I replicate GPT partition scheme from /dev/sda to /dev/sdd (RAID array rebuild)?

The syntax is:

```
# sgdisk -R {SECOND-DEVICE-NAME-HERE} /dev/sda  
# sgdisk -R /dev/sdd /dev/sda
```

To randomize the GUID on the /dev/sdd, enter:

```
# sgdisk -G /dev/sdd
```

Finally, verify that both hard drives have the same partitioning schema:

```
# sgdisk -p /dev/sda  
# sgdisk -p /dev/sdd
```

Finally, use mdadm command as explained earlier to rebuild the RAID array on Linux.
